## **Bricasti Design committed to developing leading-edge outboard signal processors for international pro-audio marketplace**

*Innovative software/hardware company founded in 2004 by Brian Zolner and Casey Dowdell*

*Congress Center, Frankfurt am Main:* During the **Musikmesse 2009 International Trade Fair**, which opens here today and runs until April 4, **Bricasti Design** will reinforce its commitment to the development of leading-edge signal processors for music-recording studios, post-production, film re-recording stages, broadcast-TV and audio-mastering facilities.

In 2004, **Brian Zolner** and **Casey Dowdell** created Bricasti Design to bring Casey's fresh ideas in algorithmic reverberation to a worldwide market that Brian had developed over the previous 20 years. Since the introduction in 2007 of its **Model 7 Stereo Reverb Processor**, Bricasti Design has received both public acclaim as well as hundreds of personal correspondences that evidence a growing and enthusiastic user base. As a result, the M7 is now in regular use within more than 23 countries, with well over half of the company's expanding sales being outside of its own home country.

The unique sound of the M7, which offers acoustic realism as well as the "better than real" sounds and control only available in algorithm-based reverberation, has gained strong acceptance in music, film and broadcast production.

Earlier this year, Bricasti Design completed its original vision of a complete reverberation system with the introduction of its **Model 10 Remote Console**. The M10 lets users bring together up to eight M7s for either multiple stereo or surround applications, creating a single integrated system with a single point of control.

The **M7 Stereo Reverb Processor** provides the highest level of musicality and ease of control imaginable in a processor dedicated to the task of reverberation. Incorporating a modern, high-resolution digital design utilizing an array of the latest DSP processors, the M7 provides a platform for the long overdue next step in reverb-processing algorithms. A separate, fully-differential analog section and dedicated transformer-based linear power supply provide enhanced analog specifications.

"No matter the application," Zolner considers, "stereo or multi-channel, film sound or music, the combination of Bricasti Design's M7 and M10 has raised the standard in sonic performance, usability, and flexibility of configuration for the growing base of users around the world."

Recent high-visibility Model 7 customers include Grammy® Award-winning engineer/producer **Al Schmitt**, working at Capitol Studio; producer/arranger/musician **Rafa Sardina** working on a number of CD projects; independent engineer/producer **Chris Spilfogel** working at Westlake Studios, Hollywood; mixer/engineer/producer **Dave Reitzas**, working at a number of leading facilities; and leading UK-based engineer/producer **Cenzo Townshend** working at London's Metropolis Studios.
